

Double-Take Migration Consulting Services

How are you going to complete your server or application migration without impacting your users and business?

Whether you are migrating a single server, or coordinating the migration of your entire datacenter, Vision's Double-Take migration experts can leverage the functionality included in Double-Take Availability to help take the stress out of your migration through a combination of technology and expertise to simplify the job and eliminate virtually all downtime required to complete it.

Unlike other solutions, Double-Take Availability allows you to accelerate your migration by enabling the migration process without outage of the production server. Utilizing patented workload migration technology; Double-Take Availability is able to port the system state, registry and security identifiers of the production server to the machine, whether it is physical or virtual, without any impact to the production server. Changes are continuously replicated to the new server in real time enabling the cut over to be completed within a very short outage window.

The Vision Solutions Double-Take Migration service is performed and managed with the guidance of a Vision Solutions Double-Take subject matter expert, and includes three important phases:

- First, a Vision Professional Services Engineer will conduct a pre-migration consultation with you and your team, to clearly identify your goals and migration timelines.
- Next, with your assistance, Vision engineers install and configure Double-Take Availability on your servers, initiate the process to migrate them to the new hardware and/or location and proactively monitor the data replication process.
- Finally, Vision Engineers will work with you and your team to oversee and assist with the final cutover of your critical application or server to ensure the process is completed smoothly and successfully.

Additionally, as part of this service, Vision's Double-Take Subject Matter Experts will teach you how to configure and manage Double-Take to migrate servers or applications in your environment.
