

IT Protection and Recovery Planning Services

IT managers and executives know what it is like to be vulnerable to the possibility of a sustained loss of a critical business application. Fact is, it's always back-of-mind. The hard part is often quantifying this vulnerability in order to make a detailed business case for the implementation of mitigating strategies and technologies.

Vision Solutions has nearly 20 years experience providing IT protection and recovery planning services to our customers. Not only are we experts in protection and recovery technologies, but we fully understand the entire business methodology of data availability. When you engage Vision Solutions to help you perform IT availability and recovery planning services, we'll help you through this critical process in many important ways:

- Identify your organization's critical business functions based on data/application integrity.
- Calculate all costs associated with the possible disruption scenarios in your organization. This not only includes the financial impact of an IT-related business disruption, but also those related to productivity and goodwill.
- Determine the maximum outage that any critical business function can sustain, given your organization's service level agreements (SLAs), industry/government regulation compliance, and potential for revenue loss and expense. From this we help you calculate your recovery time objective (RTO).
- Determine how current your data must be after recovery from an outage. From this we help you determine your optimal recovery point objective (RPO).
- Establish the recovery priority of each business function within your information systems.
- Outline the various technology solutions/tactics that can be used to help your organization meet its optimum RTO and RPO levels
- Identify the members of your organization that should be part of your IT availability team as you work to implement a go-forward plan.
- Compile a comprehensive written report that not only includes the findings from this IT protection and recovery analysis, but also includes specific recommendations for a plan to move forward.

There are many IT protection and recovery technologies, but only one thing is certain: one size does not fit all. Don't let a technology choose you. Having an IT protection and recovery plan in place is essential to selecting appropriate technologies and strategies.
