

## iTERA™ HA, MIMIX® HA or ORION Solutions™ Quick Start

How valuable is your time? When it comes to implementing HA to safeguard your IBM i systems, time is valuable in two ways: First, the time it takes for members of your technical team to fully implement HA has a cost, and second, the longer it takes to deploy HA, the more time your IT operation is vulnerable.

Quick Start services for Vision's industry-standard high availability solutions facilitate quick implementation. Vision's expertise ensures a worry-free planning, implementation and testing. In addition, as part of your Quick Start package, Vision will transfer to your staff the skills necessary to monitor and manage your high availability solution.

This Quick Start service includes five components:

-First, Vision HA experts will conduct a project planning meeting to define specific implementation requirements that must be fulfilled to meet your high availability objectives.

-Next, with your assistance, we will install, configure, tune and audit the high availability solution as defined in the planning meeting.

-Vision will then provide your designated staff with training on how to monitor the processes, manage events/errors and perform planned and unplanned role swaps.

-Finally, Vision will create a customized Availability Runbook detailing your high availability implementation. Finally, Vision will design and test the processes and procedures for performing a role swap.

To learn more about iTERA HA, MIMIX HA or ORION Solutions Quick Start services, call **800-957-4511** or visit **visionsolutions.com**.

### **Benefits**

- Shortest possible implementation project cycle and more efficient use of staff.
- Minimized downtime impact on systems and users.
- Expertly customized HA protection from Day One.
- Fast-track proficiency in managing your new HA environment.

### **Deliverables:**

- Implementation planning meeting and report.
- Installation and configuration of the high availability solution for a pair of systems or LPARs, using one instance of the HA software, with up to one terabyte of data for replication.
- Creation of your customized Availability Runbook.
- Solution skills transfer.
- Role-swap design, implementation and test.

High Availability Disaster Recovery Systems and Data Management
